Complete Memory-Addressing Modes

- **Most general form**

  D(Rb,Ri,S) **Mem[Reg[Rb]+S*Reg[Ri]+D]**

  – **D:** constant "displacement"
  – **Rb:** base register: any of 16[†] registers
  – **Ri:** index register: any, except for `%rsp`
  – **S:** scale: 1, 2, 4, or 8

- **Special cases**

(Rb,Ri)	Mem[Reg[Rb]+Reg[Ri]]
D(Rb,Ri)	Mem[Reg[Rb]+Reg[Ri]+D]
(Rb,Ri,S)	Mem[Reg[Rb]+S*Reg[Ri]]
D	Mem[D]

[†]The instruction pointer may also be used (for a total of 17 registers)

Address-Computation Examples

%rdx	0xf000
%rcx	0x0100

Expression	Address Computation	Address
0x8(%rdx)	0xf000 + 0x8	0xf008
(%rdx, %rcx)	0xf000 + 0x100	0xf100
(%rdx, %rcx, 4)	0xf000 + 4*0x0100	0xf400
0x80(,%rdx, 2)	2*0xf000 + 0x80	0x1e080

Address-Computation Instruction

- `leaq` src, dest
  - src is address mode expression
  - set *dest* to address denoted by expression
- Uses
  - computing addresses without a memory reference
    - » e.g., translation of `p = &x[i];`
  - computing arithmetic expressions of the form x + k*y
    - » k = 1, 2, 4, or 8
- Example

```
long mul12(long x)
{
  return x*12;
}
```

Converted to ASM by compiler:

```
                           # x is in %rdi
leaq (%rdi,%rdi,2), %rax   # t <- x+x*2
shlq $2, %rax              # return t<<2
```

32-bit Operands on x86-64

- addl 4(%rdx), %eax
  - memory address must be 64 bits
  - operands (in this case) are 32-bit
    - » result goes into %eax
      - lower half of %rax
      - upper half is filled with zeroes

Quiz 1

What value ends up in %ecx?

```
movq $1000,%rax
movq $1,%rbx
movl 2(%rax,%rbx,2),%ecx
```

a) **0x04050607**
b) **0x07060504**
c) **0x06070809**
d) **0x09080706**

Address	Value
1009:	0x09
1008:	0x08
1007:	0x07
1006:	0x06
1005:	0x05
1004:	0x04
1003:	0x03
1002:	0x02
1001:	0x01
%rax → 1000:	0x00

Hint:

Swapxy for Ints

```
struct xy {
  int x;
  int y;
}
void swapxy(struct xy *p){
  int temp = p->x;
  p->x = p->y;
  p->y = temp;
}
```

```
swap:
  movl (%rdi), %eax
  movl 4(%rdi), %edx
  movl %edx, (%rdi)
  movl %eax, 4(%rdi)
  ret
```

- **Pointers are 64 bits**
- **What they point to are 32 bits**

Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Bytes

- **Each register has a byte version**
  - e.g., %r10: %r10b; see earlier slide for x86 registers
- **Needed for byte instructions**
  - movb (%rax, %rsi), %r10b
  - sets *only* the low byte in %r10
    - » other seven bytes are unchanged
- **Alternatives**
  - movzbq (%rax, %rsi), %r10
    - » copies byte to low byte of %r10
    - » zeroes go to higher bytes
  - movsbq (%rax, %rsi), %r10
    - » copies byte to low byte of %r10
    - » sign is extended to all higher bits

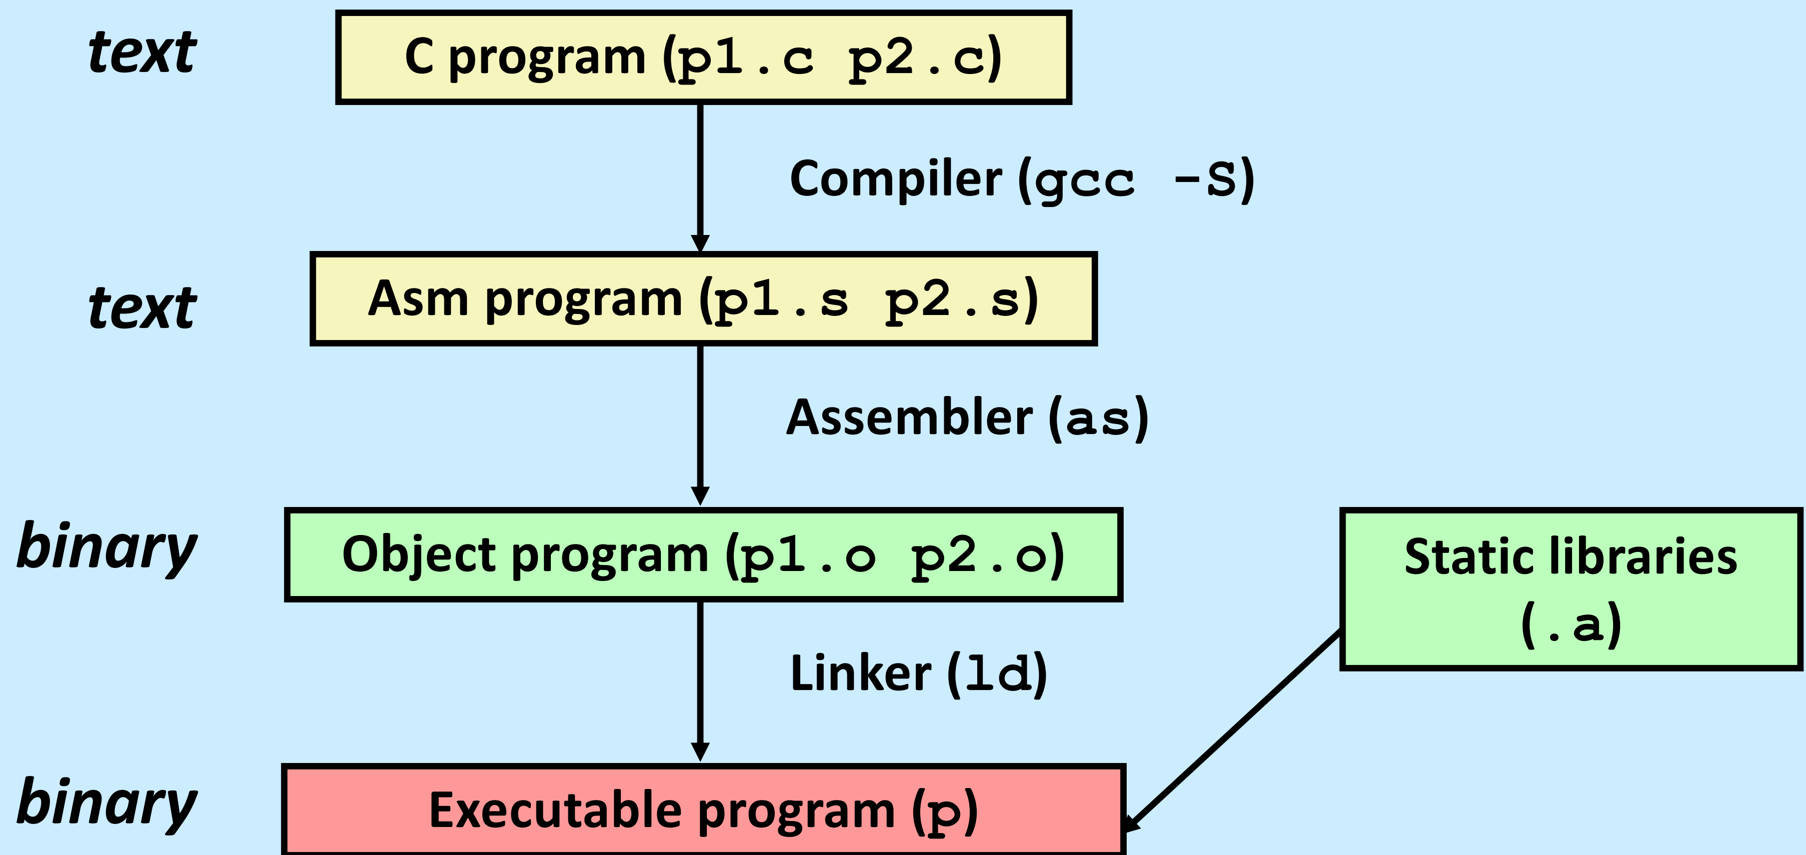
Turning C into Object Code

- Code in files `p1.c p2.c`
- Compile with command: `gcc -O1 p1.c p2.c -o p`
  - » use basic optimizations (`-O1`)
  - » put resulting binary in file `p`



Example

```
long ASum(long *a, unsigned long size) {
    long i, sum = 0;
    for (i=0; i<size; i++)
        sum += a[i];
    return sum;
}

int main() {
    long array[3] = {2,117,-6};
    long sum = ASum(array, 3);
    return sum;
}
```

Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Assembler Code

```
ASum:
        testq   %rsi, %rsi
        je      .L4
        movq    %rdi, %rax
        leaq    (%rdi,%rsi,8), %rcx
        movl    $0, %edx
.L3:
        addq    (%rax), %rdx
        addq    $8, %rax
        cmpq    %rcx, %rax
        jne     .L3
.L1:
        movq    %rdx, %rax
        ret
.L4:
        movl    $0, %edx
        jmp     .L1
```

```
main:
        subq    $32, %rsp
        movq    $2, (%rsp)
        movq    $117, 8(%rsp)
        movq    $-6, 16(%rsp)
        movq    %rsp, %rdi
        movl    $3, %esi
        call    ASum
        addq    $32, %rsp
        ret
```

Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Object Code

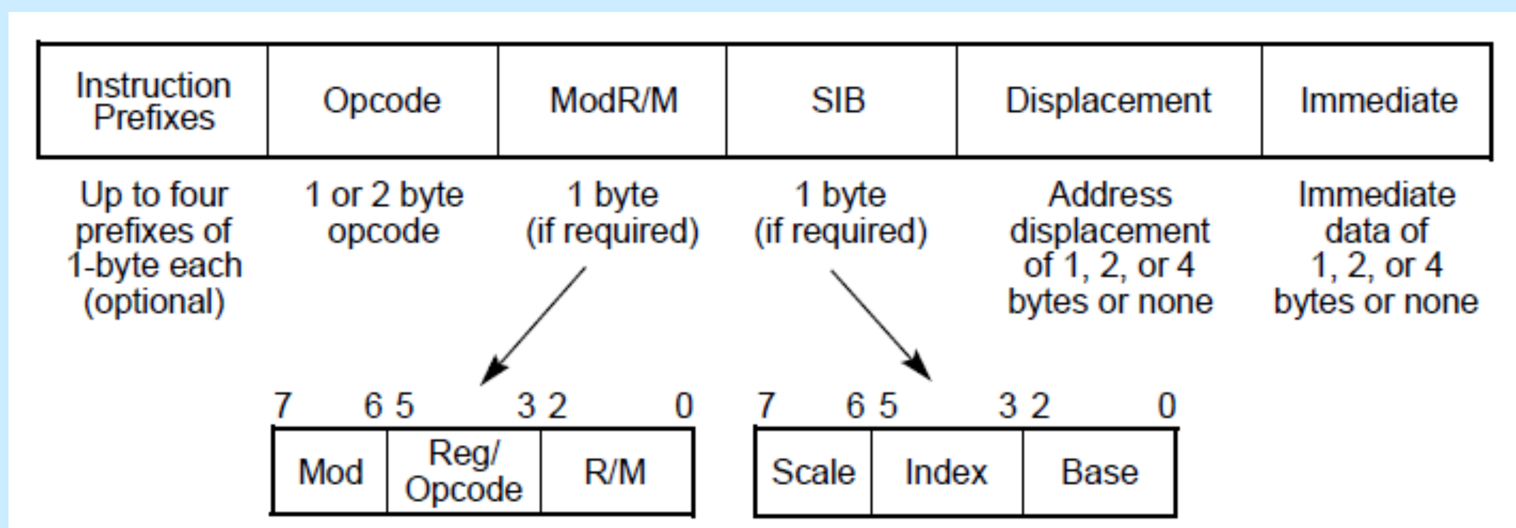
Code for `ASum`

```
0x1125 <ASum>:
    0x48
    0x85
    0xf6
    0x74
    0x1c
    0x48
    0x89
    0xf8
    0x48
    0x8d
    0x0c
    0xf7
     .
     .
     .
```

- Total of 39 bytes
- Each instruction: 1, 2, or 3 bytes
- Starts at address `0x1125`

- **Assembler**
  - translates `.s` into `.o`
  - binary encoding of each instruction
  - nearly complete image of executable code
  - missing linkages between code in different files
- **Linker**
  - resolves references between files
  - combines with static run-time libraries
    - » e.g., code for `printf`
  - some libraries are *dynamically linked*
    - » linking occurs when program begins execution

Instruction Format



Disassembling Object Code

Disassembled

```
0000000000001125 <ASum>:
    1125:       48 85 f6                test   %rsi,%rsi
    1128:       74 1c                   je     1146 <ASum+0x21>
    112a:       48 89 f8                mov    %rdi,%rax
    112d:       48 8d 0c f7             lea    (%rdi,%rsi,8),%rcx
    1131:       ba 00 00 00 00          mov    $0x0,%edx
    1136:       48 03 10                add    (%rax),%rdx
    1139:       48 83 c0 08             add    $0x8,%rax
    113d:       48 39 c8                cmp    %rcx,%rax
    1140:       75 f4                   jne    1136 <ASum+0x11>
    1142:       48 89 d0                mov    %rdx,%rax
    1145:       c3                      retq
    1146:       ba 00 00 00 00          mov    $0x0,%edx
    114b:       eb f5                   jmp    1142 <ASum+0x1d>
```

- **Disassembler**

  `objdump -d <file>`

  – **useful tool for examining object code**

  – **produces approximate rendition of assembly code**

Alternate Disassembly

Object

```
0x1125:
    0x48
    0x85
    0xf6
    0x74
    0x1c
    0x48
    0x89
    0xf8
    0x48
    0x8d
    0x0c
    0xf7
      .
      .
      .
```

Disassembled

```
Dump of assembler code for function ASum:
   0x1125 <+0>:     test   %rsi,%rsi
   0x1128 <+3>:     je     0x1146 <ASum+33>
   0x112a <+5>:     mov    %rdi,%rax
   0x112d <+8>:     lea    (%rdi,%rsi,8),%rcx
   0x1131 <+12>:    mov    $0x0,%edx
     ...
```

- **Within gdb debugger**

  `gdb <file>`

  `disassemble ASum`

  – disassemble the ASum object code

  `x/39xb ASum`

  – examine the 39 bytes starting at `ASum`

How Many Instructions are There?

- We cover ~30
- Implemented by Intel:
  - 80 in original 8086 architecture
  - 7 added with 80186
  - 17 added with 80286
  - 33 added with 386
  - 6 added with 486
  - 6 added with Pentium
  - 1 added with Pentium MMX
  - 4 added with Pentium Pro
  - 8 added with SSE
  - 8 added with SSE2
  - 2 added with SSE3
  - 14 added with x86-64
  - 10 added with VT-x
  - 2 added with SSE4a
- Total: 198
- Doesn't count:
  - floating-point instructions
    - ~100
  - SIMD instructions
    - lots
  - AMD-added instructions
  - undocumented instructions

Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Some Arithmetic Operations

- **Two-operand instructions:**

Format		Computation	
`addl`	Src,Dest	Dest = Dest + Src	
`subl`	Src,Dest	Dest = Dest – Src	
`imull`	Src,Dest	Dest = Dest * Src	
`shll`	Src,Dest	Dest = Dest << Src	Also called sall
`sarl`	Src,Dest	Dest = Dest >> Src	Arithmetic
`shrl`	Src,Dest	Dest = Dest >> Src	Logical
`xorl`	Src,Dest	Dest = Dest ^ Src	
`andl`	Src,Dest	Dest = Dest & Src	
`orl`	Src,Dest	Dest = Dest | Src	

  – watch out for argument order!

Some Arithmetic Operations

- **One-operand Instructions**

`incl`	Dest	= Dest + 1
`decl`	Dest	= Dest – 1
`negl`	Dest	= – Dest
`notl`	Dest	= ~Dest

- **See textbook for more instructions**

- **See Intel documentation for even more**

Arithmetic Expression Example

```
int arith(int x, int y, int z)
{
  int t1 = x+y;
  int t2 = z+t1;
  int t3 = x+4;
  int t4 = y * 48;
  int t5 = t3 + t4;
  int rval = t2 * t5;
  return rval;
}
```

```
arith:
    leal   (%rdi,%rsi), %eax
    addl   %edx, %eax
    leal   (%rsi,%rsi,2), %edx
    shll   $4, %edx
    leal   4(%rdi,%rdx), %ecx
    imull  %ecx, %eax
    ret
```

Understanding `arith`

```
int arith(int x, int y, int z)
{
  int t1 = x+y;
  int t2 = z+t1;
  int t3 = x+4;
  int t4 = y * 48;
  int t5 = t3 + t4;
  int rval = t2 * t5;
  return rval;
}
```

%rdx	z
%rsi	y
%rdi	x

```
leal   (%rdi,%rsi), %eax
addl   %edx, %eax
leal   (%rsi,%rsi,2), %edx
shll   $4, %edx
leal   4(%rdi,%rdx), %ecx
imull  %ecx, %eax
ret
```

Understanding `arith`

```
int arith(int x, int y, int z)
{
  int t1 = x+y;
  int t2 = z+t1;
  int t3 = x+4;
  int t4 = y * 48;
  int t5 = t3 + t4;
  int rval = t2 * t5;
  return rval;
}
```

%rdx	z
%rsi	y
%rdi	x

```
leal   (%rdi,%rsi), %eax     # eax = x+y      (t1)
addl   %edx, %eax            # eax = t1+z     (t2)
leal   (%rsi,%rsi,2), %edx   # edx = 3*y      (t4)
shll   $4, %edx              # edx = t4*16    (t4)
leal   4(%rdi,%rdx), %ecx    # ecx = x+4+t4   (t5)
imull  %ecx, %eax            # eax *= t5      (rval)
ret
```

Observations about `arith`

```
int arith(int x, int y, int z)
{
  int t1 = x+y;
  int t2 = z+t1;
  int t3 = x+4;
  int t4 = y * 48;
  int t5 = t3 + t4;
  int rval = t2 * t5;
  return rval;
}
```

- Instructions in different order from C code
- Some expressions might require multiple instructions
- Some instructions might cover multiple expressions

```
leal   (%rdi,%rsi), %eax     # eax = x+y      (t1)
addl   %edx, %eax            # eax = t1+z     (t2)
leal   (%rsi,%rsi,2), %edx   # edx = 3*y      (t4)
shll   $4, %edx              # edx = t4*16    (t4)
leal   4(%rdi,%rdx), %ecx    # ecx = x+4+t4   (t5)
imull  %ecx, %eax            # eax *= t5      (rval)
ret
```

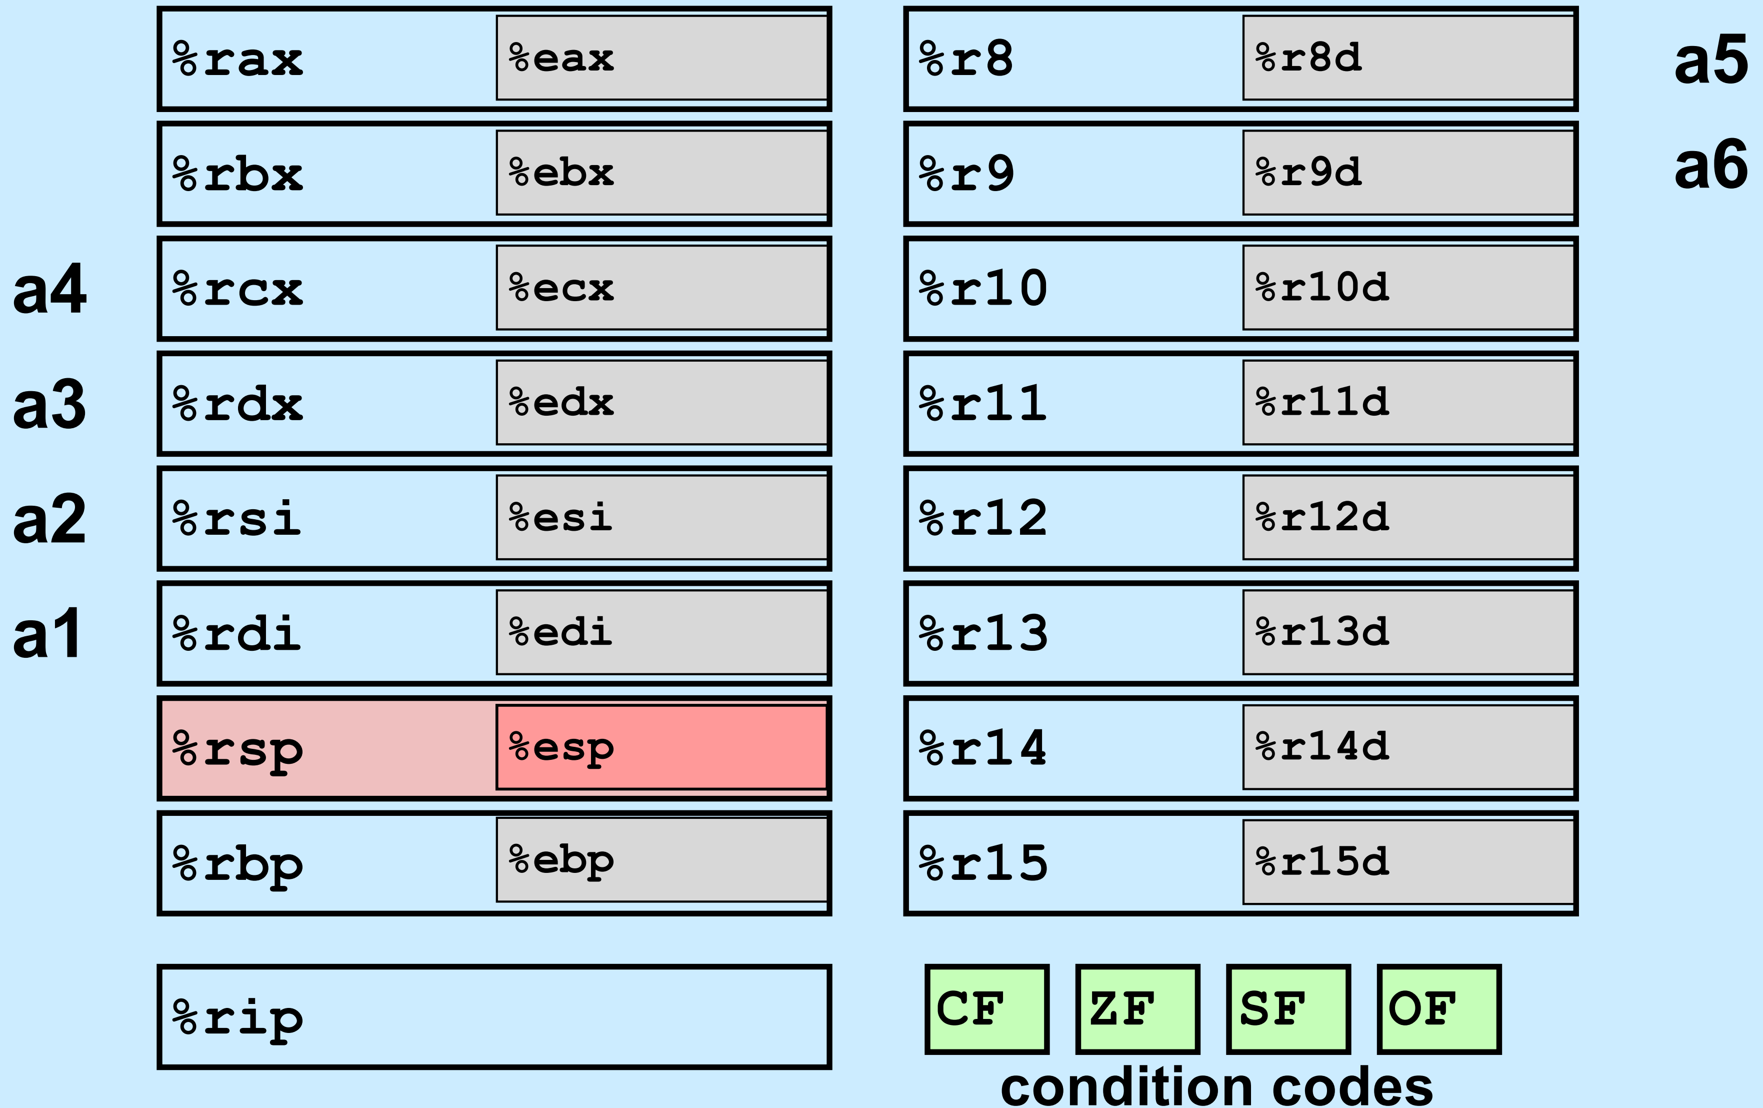
Another Example

```
int logical(int x, int y)
{
  int t1 = x^y;
  int t2 = t1 >> 17;
  int mask = (1<<13) - 7;
  int rval = t2 & mask;
  return rval;
}
```

$2^{13} = 8192$, $2^{13} - 7 = 8185$

```
xorl %esi, %edi        # edi = x^y        (t1)
sarl $17, %edi         # edi = t1>>17     (t2)
movl %edi, %eax        # eax = edi
andl $8185, %eax       # eax = t2 & mask (rval)
```

Processor State (x86-64, Partial)



Condition Codes (Implicit Setting)

- **Single-bit registers**

CF	carry flag (for unsigned)	SF	sign flag (for signed)
ZF	zero flag	OF	overflow flag (for signed)

- **Implicitly set (think of it as side effect) by arithmetic operations**

  example: *addl/addq* Src,Dest ↔ `t = a+b`

  CF set if carry out from most significant bit or borrow (unsigned overflow)

  ZF set if `t == 0`

  SF set if `t < 0` (as signed)

  OF set if two's-complement (signed) overflow
  `(a>0 && b>0 && t<0) || (a<0 && b<0 && t>=0)`

- **Not set by `lea` instruction**

Condition Codes (Explicit Setting: Compare)

- **Explicit setting by compare instruction**

  `cmpl/cmpq` src2, src1

  compares src1:src2

  `cmpl b,a` like computing `a-b` without setting destination

  CF set if carry out from most significant bit or borrow (used for unsigned comparisons)

  ZF set if `a == b`

  SF set if `(a-b) < 0` (as signed)

  OF set if two's-complement (signed) overflow

```
(a>0 && b<0 && (a-b)<0) || (a<0 && b>0 && (a-b)>0)
```

Condition Codes (Explicit Setting: Test)

- **Explicit setting by test instruction**

  `testl/testq` **src2, src1**
  `testl b,a` **like computing** `a&b` **without setting destination**

  – **sets condition codes based on value of Src1 & Src2**
  – **useful to have one of the operands be a mask**

  ZF set when `a&b == 0`

  SF set when `a&b < 0`

Reading Condition Codes

- **SetX instructions**
  - **set single byte based on combinations of condition codes**

SetX	Condition	Description
`sete`	`ZF`	Equal / Zero
`setne`	`~ZF`	Not Equal / Not Zero
`sets`	`SF`	Negative
`setns`	`~SF`	Nonnegative
`setg`	`~(SF^OF)&~ZF`	Greater (Signed)
`setge`	`~(SF^OF)`	Greater or Equal (Signed)
`setl`	`(SF^OF)`	Less (Signed)
`setle`	`(SF^OF)|ZF`	Less or Equal (Signed)
`seta`	`~CF&~ZF`	Above (unsigned)
`setb`	`CF`	Below (unsigned)

Reading Condition Codes (Cont.)

- **SetX instructions:**
  - set single byte based on combination of condition codes
- **Uses byte registers**
  - does not alter remaining 7 bytes
  - typically use `movzbl` to finish job

```
int gt(int x, int y)
{
  return x > y;
}
```

%rax	%eax	%ah	%al

Body

```
cmpl %esi, %edi      # compare x : y
setg %al             # %al = x > y
movzbl %al, %eax     # zero rest of %eax/%rax
```

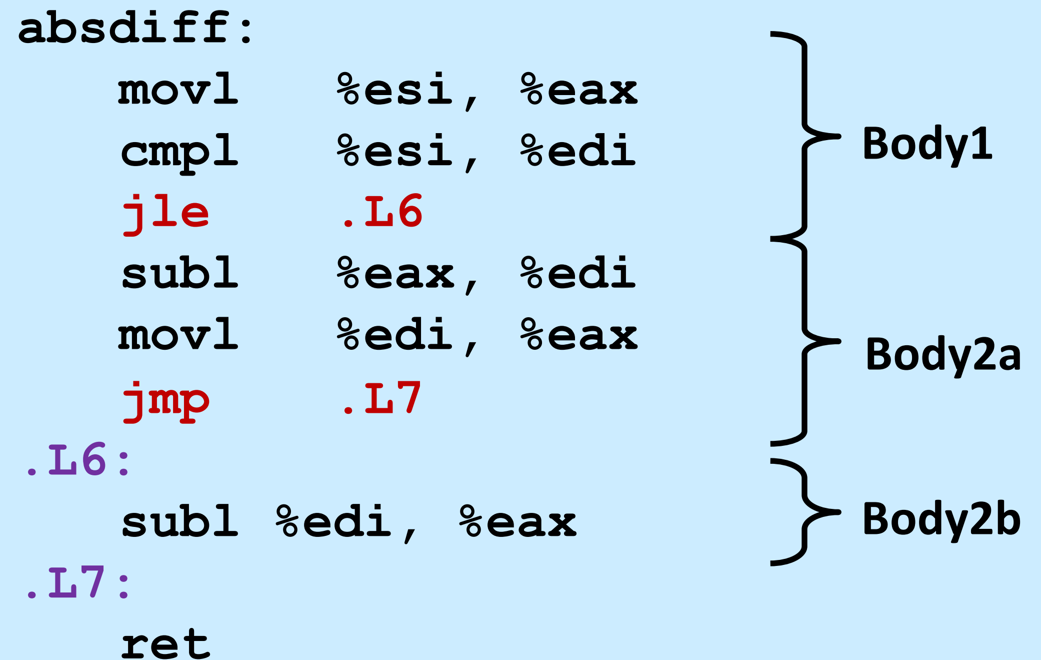
Jumping

- **jX instructions**
  - Jump to different part of program depending on condition codes

jX	Condition	Description
`jmp`	`1`	Unconditional
`je`	`ZF`	Equal / Zero
`jne`	`~ZF`	Not Equal / Not Zero
`js`	`SF`	Negative
`jns`	`~SF`	Nonnegative
`jg`	`~(SF^OF)&~ZF`	Greater (Signed)
`jge`	`~(SF^OF)`	Greater or Equal (Signed)
`jl`	`(SF^OF)`	Less (Signed)
`jle`	`(SF^OF)|ZF`	Less or Equal (Signed)
`ja`	`~CF&~ZF`	Above (unsigned)
`jb`	`CF`	Below (unsigned)

Conditional-Branch Example

```
int absdiff(int x, int y)
{
    int result;
    if (x > y) {
      result = x-y;
    } else {
      result = y-x;
    }
    return result;
}
```

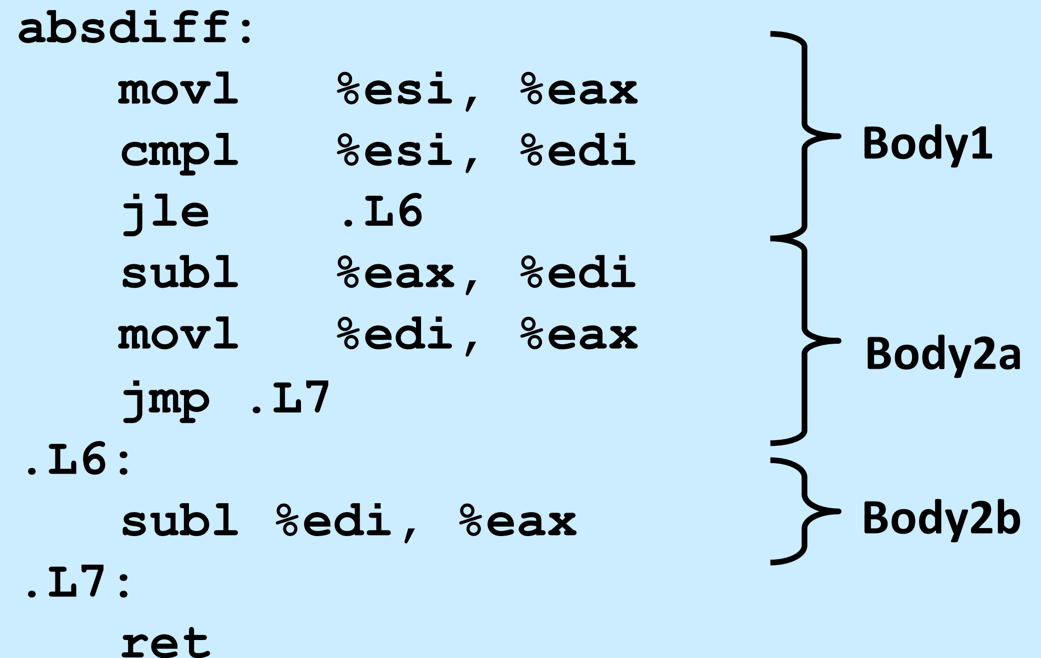


x in %edi

y in %esi

Conditional-Branch Example (Cont.)

```
int goto_ad(int x, int y)
{
  int result;
  if (x <= y) goto Else;
  result = x-y;
  goto Exit;
Else:
  result = y-x;
Exit:
  return result;
}
```



- C allows "goto" as means of transferring control
  - closer to machine-level programming style
- Generally considered bad coding style

General Conditional-Expression Translation

C Code

```
val = Test ? Then_Expr : Else_Expr;
```

```
val = x>y ? x-y : y-x;
```

Goto Version

```
  nt = !Test;
  if (nt) goto Else;
  val = Then_Expr;
  goto Done;
Else:
  val = Else_Expr;
Done:
  . . .
```

- **Test** is expression returning integer
  - == 0 interpreted as false
  - ≠ 0 interpreted as true
- Create separate code regions for **then** and **else** expressions
- Execute appropriate one

"Do-While" Loop Example

C Code

```
int pcount_do(unsigned x)
{
  int result = 0;
  do {
    result += x & 0x1;
    x >>= 1;
  } while (x);
  return result;
}
```

Goto Version

```
int pcount_do(unsigned x)
{
  int result = 0;
loop:
  result += x & 0x1;
  x >>= 1;
  if (x)
    goto loop;
  return result;
}
```

- **Count number of 1's in argument x ("popcount")**
- **Use conditional branch either to continue looping or to exit loop**

"Do-While" Loop Compilation

Goto Version

```
int pcount_do(unsigned x)  {
  int result = 0;
loop:
  result += x & 0x1;
  x >>= 1;
  if (x)
    goto loop;
  return result;
}
```

Registers:

%edi	x
%eax	result

```
  movl   $0, %eax      #   result = 0
.L2:     # loop:
  movl   %edi, %ecx
  andl   $1, %ecx      #   t = x & 1
  addl   %ecx, %eax    #   result += t
  shrl   %edi          #   x >>= 1
  jne    .L2           #   if !0, goto loop
```

General "Do-While" Translation

C Code

```
do
  Body
  while (Test);
```

Goto Version

```
loop:
  Body
  if (Test)
    goto loop
```

- **Body:**

```
{
  Statement1;
  Statement2;
    …
  Statementn;
}
```

- **Test returns integer**
  - **= 0 interpreted as false**
  - **≠ 0 interpreted as true**

"While" Loop Example

C Code

```
int pcount_while(unsigned x) {
  int result = 0;
  while (x) {
    result += x & 0x1;
    x >>= 1;
  }
  return result;
}
```

Goto Version

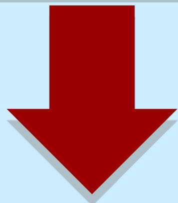
```
int pcount_do(unsigned x)  {
  int result = 0;
  if (!x) goto done;
loop:
  result += x & 0x1;
  x >>= 1;
  if (x)
    goto loop;
done:
  return result;
}
```

- **Is this code equivalent to the do-while version?**
  - **must jump out of loop if test fails**

General "While" Translation

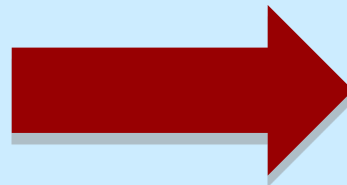
While version

```
while (Test)
  Body
```



Do-While Version

```
  if (!Test)
    goto done;
  do
    Body
    while(Test);
done:
```



Goto Version

```
  if (!Test)
    goto done;
loop:
  Body
  if (Test)
    goto loop;
done:
```

"For" Loop Example

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
  int i;
  int result = 0;
  for (i = 0; i < WSIZE; i++) {
    unsigned mask = 1 << i;
    result += (x & mask) != 0;
  }
  return result;
}
```

- **Is this code equivalent to other versions?**

“For” Loop Form

General Form

```
for (Init; Test; Update )

    Body
```

```
for (i = 0; i < WSIZE; i++) {
    unsigned mask = 1 << i;
    result += (x & mask) != 0;
}
```

Init

```
i = 0
```

Test

```
i < WSIZE
```

Update

```
i++
```

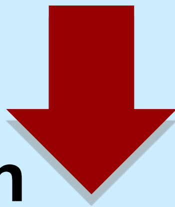
Body

```
{
  unsigned mask = 1 << i;
  result += (x & mask) != 0;
}
```

"For" Loop → While Loop

For Version

```
for (Init; Test; Update )
     Body
```



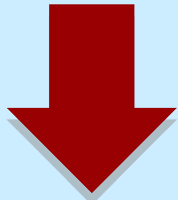
While Version

```
Init;
while (Test ) {
     Body
     Update;
}
```

"For" Loop → … → Goto

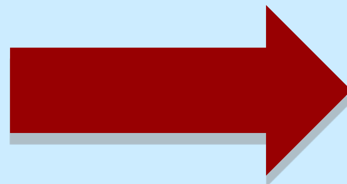
For Version

```
for (Init; Test; Update )
    Body
```

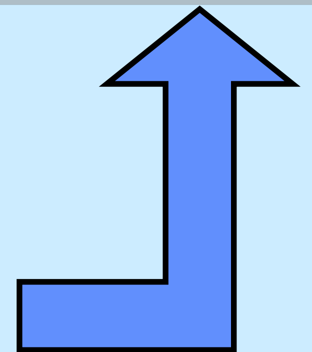


While Version

```
Init;
while (Test ) {
    Body
    Update;
}
```



```
  Init;
  if (!Test)
    goto done;
  do
    Body
    Update
  while(Test);
done:
```



```
  Init;
  if (!Test)
    goto done;
loop:
  Body
  Update
  if (Test)
    goto loop;
done:
```

"For" Loop Conversion Example

C Code

```
#define WSIZE 8*sizeof(int)
int pcount_for(unsigned x) {
  int i;
  int result = 0;
  for (i = 0; i < WSIZE; i++) {
    unsigned mask = 1 << i;
    result += (x & mask) != 0;
  }
  return result;
}
```

Initial test can be optimized away

Goto Version

```
int pcount_for_gt(unsigned x) {
  int i;
  int result = 0;
  i = 0;                          Init
  if (!(i < WSIZE))               !Test
    goto done;
 loop:
  {                               Body
    unsigned mask = 1 << i;
    result += (x & mask) != 0;
  }
  i++;                            Update
  if (i < WSIZE)                  Test
    goto loop;
 done:
  return result;
}
```

(The `if (!(i < WSIZE)) goto done;` lines are crossed out.)
