I/O System Calls

- int file_descriptor = open(pathname, mode [, permissions])
- int close (file descriptor)
- ssize_t count = read(file_descriptor, buffer_address, buffer_size)
- ssize_t count = write(file_descriptor, buffer address, buffer size)

Standard File Descriptors

```
int main() {
 char buf[BUFSIZE];
 int n;
 const char *note = "Write failed\n";
 while ((n = read(0, buf, sizeof(buf))) > 0)
   if (write(1, buf, n) != n) {
         write(2, note, strlen(note));
         exit(1);
   }
 return(0);
}
```

Standard I/O Library

CS33 Intro to Computer Systems

Standard I/O

- FILE *stdin;
- FILE *stdout;
- FILE *stderr;

- // declared in stdio.h
 // declared in stdio.h
 // declared in stdio.h

Buffered Output

- printf("xy");
- printf("zz");
- printf("y\n");

CS33 Intro to Computer Systems

XIX-6 Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Unbuffered Output

fprintf(stderr, "xy");

fprintf(stderr, "zz");

fprintf(stderr, "y\n");

A Program

```
int main(int argc, char *argv[]) {
 if (argc != 2) {
    fprintf(stderr, "Usage: echon reps\n");
   exit(1);
  }
 int reps = atoi(argv[1]);
 if (reps > 2) {
    fprintf(stderr, "reps too large, reduced to 2\n");
   reps = 2;
  }
  char buf[256];
 while (fgets(buf, 256, stdin) != NULL)
    for (int i=0; i<reps; i++)
      fputs(buf, stdout);
 return(0);
```

From the Shell ...

\$ echon 1

- stdout (fd 1) and stderr (fd 2) go to the display
- stdin (fd 0) comes from the keyboard
- \$ echon 1 > Output
 - stdout goes to the file "Output" in the current directory
 - stderr goes to the display
 - stdin comes from the keyboard
- \$ echon 1 < Input
 - stdin comes from the file "Input" in the current directory

Redirecting Stdout in C

```
if ((pid = fork()) == 0) {
   /* set up file descriptor 1 in the child process */
   close(1);
   if (open("/home/twd/Output", O WRONLY) == -1) {
      perror("/home/twd/Output");
      exit(1);
   }
   char *argv[] = {"echon", "2", NULL};
   execv("/home/twd/bin/echon", argv);
   exit(1);
}
/* parent continues here */
waitpid(pid, 0, 0); // wait for child to terminate
```

Allocation of File Descriptors

 Whenever a process requests a new file descriptor, the lowest-numbered file descriptor not already associated with an open file is selected; thus

```
#include <fcntl.h>
#include <unistd.h>
```

```
close(0);
fd = open("file", O RDONLY);
```

 will always associate *file* with file descriptor 0 (assuming that *open* succeeds)

Redirecting Output ... Twice

```
if (fork() == 0) {
   /* set up file descriptors 1 and 2 in the child process */
   close(1);
   close(2);
   if (open("/home/twd/Output", O WRONLY) == -1) {
      exit(1);
   }
   if (open("/home/twd/Output", O WRONLY) == -1) {
      exit(1);
   char *argv[] = {"echon", 2, NULL};
   execv("/home/twd/bin/echon", argv);
   exit(1);
/* parent continues here */
```

```
CS33 Intro to Computer Systems
```

From the Shell ...

\$ echon 1 >Output 2>Output

- both stdout and stderr go to Output file

Redirected Output

Quiz 1

- Suppose we run
 - \$ echon 3 >Output 2>Output
- The input line is
 - Х
- What is the final content of Output?

a) reps too large, reduced to 2\nX\nX\n
b) X\nX\nreps too large, reduced to 2\n
c) X\nX\n too large, reduced to 2\n

Sharing Context Information

```
if (fork() == 0) {
   /* set up file descriptors 1 and 2 in the child process */
   close(1);
   close(2);
   if (open("/home/twd/Output", O WRONLY) == -1) {
      exit(1);
   }
   dup(1); /* set up file descriptor 2 as a duplicate of 1 */
   char *argv[] = {"echon", 2};
   execv("/home/twd/bin/echon", argv);
  exit(1);
}
/* parent continues here */
```

Redirected Output After Dup

CS33 Intro to Computer Systems

XIX-22 Copyright © 2023 Thomas W. Doeppner. All rights reserved.

From the Shell ...

\$ echon 3 >Output 2>&1

- stdout goes to Output file, stderr is the dup of fd 1

- with input "X\n" it now produces in Output:

reps too large, reduced to 2\nX\nX\n

Fork and File Descriptors

```
int logfile = open("log", O WRONLY);
if (fork() == 0) {
   /* child process computes something, then does: */
   write(logfile, LogEntry, strlen(LogEntry));
   • • •
   exit(0);
}
/* parent process computes something, then does: */
write(logfile, LogEntry, strlen(LogEntry));
•••
```

File Descriptors After Fork

CS33 Intro to Computer Systems

XIX-25 Copyright © 2023 Thomas W. Doeppner. All rights reserved.

Quiz 2

```
int main() {
    if (fork() == 0) {
        fprintf(stderr, "Child");
        exit(0);
    }
    fprintf(stderr, "Parent");
}
```

Suppose the program is run as:

\$ prog >file 2>&1

What is the final content of file? (Assume writes are "atomic".)

- a) either "Childt" or "Parent"
- b) either "Child" or "Parent"
- c) either "ChildParent" or "ParentChild"

Working Directory

- Maintained in kernel for each process
 - paths not starting from "/" start with the working directory
 - changed by use of the chdir system call
 - » cd shell command
 - displayed (via shell) using "pwd"
 - » how is this done?

Open

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
int open(const char *path, int options [, mode_t mode])
```

open for reading only
open for writing only
open for reading and writing
set the file offset to <i>end of file</i> prior to each <i>writ</i> e
if the file does not exist, then create it, setting its mode to <i>mode</i> adjusted by <i>umask</i>
if O_EXCL and O_CREAT are set, then open fails if the file exists
delete any previous contents of the file

Appending Data to a File (1)

int fd = open("file", O_WRONLY);
lseek(fd, 0, SEEK_END);
 // sets the file location to the end
write(fd, buffer, bsize);
 // does this always write to the
 // end of the file?

Appending Data to a File (2)

int fd = open("file", O_WRONLY | O_APPEND);
write(fd, buffer, bsize);
 // this is guaranteed to write to the
 // end of the file

In the Shell ...

% program >> file

File Access Permissions

- Who's allowed to do what?
 - who
 - » user (owner)
 - » group
 - » others (rest of the world)
 - what
 - » read
 - » write
 - » execute

Permissions Example

adm group: joe, angie

\$ ls -lR								
•••								
total 2								
drwxr-xx	2	joe	adm	1024	Dec	17	13:34	A
drwxr	2	joe	adm	1024	Dec	17	13:34	В
./A:								
total 1								
-rw-rw-rw-	1	joe	adm	593	Dec	17	13:34	x
./B:								
total 2								
-rrw-rw-	1	joe	adm	446	Dec	17	13:34	x
-rwrw-	1	angie	adm	446	Dec	17	13:45	У

Setting File Permissions

```
#include <sys/types.h>
#include <sys/stat.h>
int chmod(const char *path, mode t mode)
```

- sets the file permissions of the given file to those specified in *mode*
- only the owner of a file and the superuser may change its permissions
- nine combinable possibilities for mode (read/write/execute for user, group, and others)
 - » S_IRUSR (0400), S_IWUSR (0200), S_IXUSR (0100)
 - \gg S_IRGRP (040), S_IWGRP (020), S_IXGRP (010)
 - » S_IROTH (04), S_IWOTH (02), S_IXOTH (01)

Umask

- Standard programs create files with "maximum needed permissions" as mode
 - compilers: 0777
 - editors: 0666
- Per-process parameter, *umask*, used to turn off undesired permission bits
 - e.g., turn off all permissions for others, write permission for group: set umask to 027
 - » compilers: permissions = 0777 & ~(027) = 0750
 - » editors: permissions = 0666 & ~(027) = 0640
 - set with umask system call or (usually) shell command

Creating a File

Use either open or creat

- open(const char *pathname, int flags, mode_t mode)
 - » flags must include O_CREAT
- creat(const char *pathname, mode_t mode)
 - » open is preferred
- The mode parameter helps specify the permissions of the newly created file
 - permissions = mode & ~umask

Quiz 3

```
int main() {
    int fd = open("file", O_RDWR|O_CREAT, 0666);
    unlink("file");
    PutStuffInFile(fd);
    GetStuffFromFile(fd);
    return 0;
}
```

Assume that *PutStuffInFile* writes to the given file, and *GetStuffFromFile* reads from the file.

- a) This program is doomed to failure, since the file is deleted before it's used
- b) Because the file is used after the unlink call, it won't be deleted
- c) The file will be deleted when the program terminates
